

## THE GOLDEN FALLS OF GRENADA

The Golden Falls of Grenada, the most beautiful and interesting fall in Grenada, deep into the rain forest, Grenada's only hot and cold sulphuric waterfall, this is so majestic. The rocks are golden brown from the sulphur in the water. The geothermal effect is caused by Grenada's volcanic origin. The only way to reach the Golden Falls is to hike through the rainforest. There is a large basin at the foot of the falls in which you can breathe in the lovely warm water.

A mountainous, well-watered island like Grenada is bound to have many waterfalls throughout its one hundred and thirty-three square miles. But the most recently discovered one is unique Golden Falls.

Only this waterfall has two cascades of water next to each other. This geothermal effect is caused by Grenada's origin. Although it has no active volcanoes, not far below the surface is some areas, where heat from the earth's core leaks out, warming the waters of some of its streams. In addition, the sulphurous nature of the volcanic formation colours the water yellow, so it was named 'Golden Falls'. It is truly a natural wonder left alone to be enjoyed. Grenada is very proud of this unique Golden Falls on the Island.
