

## twool sustainable wool nets

twool sustainable garden net is the first netting of its kind made from underused renewable British wool as an alternative to plastic net. It is versatile, strong and durable and is biodegradable. We have developed our nets using twool naked yarn: a blend of Whiteface Dartmoor wool and Zwartbles a natural-coloured wool. Blended together they give a beautiful granite look which is not only incredibly strong but also complements planting.

twool nets can be used to support sweet peas, beans, peas, in the greenhouse and for general garden use. Stretched horizontally between supports, its natural colour will complement planting whilst giving full support to growing crops.

### *Ocean gardens the bigger picture, not just garden nets*

Our garden nets form part of a broader environmental wool net project currently under research and development. In 2023 we were approached by the University of Belfast and the UK Fisheries to investigate sustainable alternative materials for ocean nets, environmental ocean and riverbank restoration and sea kelp farming using twool nets and rope. We have successfully grown and harvested sea kelp and seaweeds on our rope and nets which are currently deployed at sea.

So, from humble beginnings a simple garden twine, through to garden and ocean nets we have now managed to engage British manufacturing business partners to develop environmentally sustainable solutions for growing and environmental projects using wool to replace plastic.

Go twool!
